

# Introduction to Microsoft's Master Data Services (MDS)

---

James Serra – Data Warehouse/BI/MDM Architect

[JamesSerra3@gmail.com](mailto:JamesSerra3@gmail.com)

[JamesSerra.com](http://JamesSerra.com)

# About me

- In IT for 28 years
- Worked as desktop/web/database developer, DBA, BI and DW architect, MDM, PDW
- Been perm, contractor, consultant, business owner
- MCSE for SQL Server 2012: Data Platform and BI
- SME for SQL Server 2012 certs
- *Currently a consultant working with MDS at Schlumberger as a MDM Technical Lead*
- Contributing writer for SQL Server Pro magazine
- Blog at [JamesSerra.com](http://JamesSerra.com)

# Agenda

- Do you need Master Data Management (MDM)?
- Why Master Data Management?
- MDM Scenarios & MDM Hub Architecture Styles
- Why Microsoft Data Services (MDS)?
- MDS Benefits and Key Features
- MDS UI and MDS Add-in for Excel
- Why Profisee Master Data Maestro?
- Demo
- QA

# Do you need Master Data Management (MDM)?

- Do you have instances of invalid data impacting business processes?
- Do you wish your business users could manage data themselves such as Customer and Product?
- Do you have IT resources spending time on data fixes and/or managing hierarchy definitions for the business?
- Do you have the need for data consolidation and the subsequent dissemination of the consolidated data to other systems?
- Do you have an environment of heterogeneous systems which all could benefit from a single view of domain data such as Customer or Product?
- *Don't let it be an afterthought!*

# Why Master Data Management?

- The technology, tools, and processes required to create and maintain consistent and accurate lists of master data
- Set of data objects that are at the center of business activities (Customers, Products, Cost Centers, Locations, Assets, Tasks ...). Dimension data, NOT transactional data
- Single source for enterprise master and reference data
- Business-centric versus IT-centric
- Includes business process, people, AND data

# Why Master Data Management (MDM)?

- IT/business partner provides data stewardship and data governance
- Reduces or eliminates duplicate data entry and maintenance
- Improves compliance, reporting, profitability, decision making and data quality
- Expand data management to data stewards responsible for the data

# Master Data Management (MDM) Domains/Entities

## People

Customers

Vendors

Sales People

Employees

Partners

Patients

## Things

Products

Business Units

Bill of Materials

Parts

Storage Bins

Geo Areas

Warehouses

## Abstract

Accounts

Warranties

Time

Metrics

Securities

Contracts

# Master Data Management Solution Areas

## Data Quality

- Human typographical errors; incomplete information; spreadsheet data management
- Mergers and consolidation; ERP implementations, consolidation or migration
- New purposes for old data; retire old applications such as mainframe applications
- Single point of data maintenance; BI reporting

## Compliance

- Tracking spends by customer
- State and federal mandates

## Improve Efficiency

- Different types of customer accounts
- Accurate view of data by implementing MDM and DQ
- Single point of data maintenance
- Cross sell and upsell

## Retain Customers

- Single view of customer spend, channels, cross sell and upsell

## M&A

- Merging chart of accounts; consolidate financial reporting
- Single view of product
- Single view of customers

## Improve Decisions

- Bill-to and ship-to addresses and contacts
- Pricing levels based on spend
- Relationships between buying customers (parent)

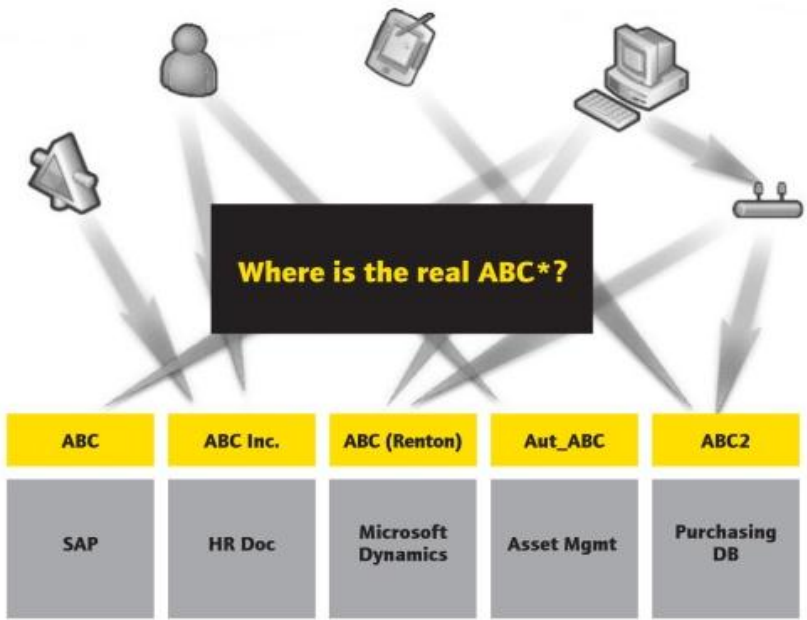

## Cross Reference

- Cross reference of same customers across multiple systems
- Survivorship of best consolidated data across multiple systems

## Golden Records

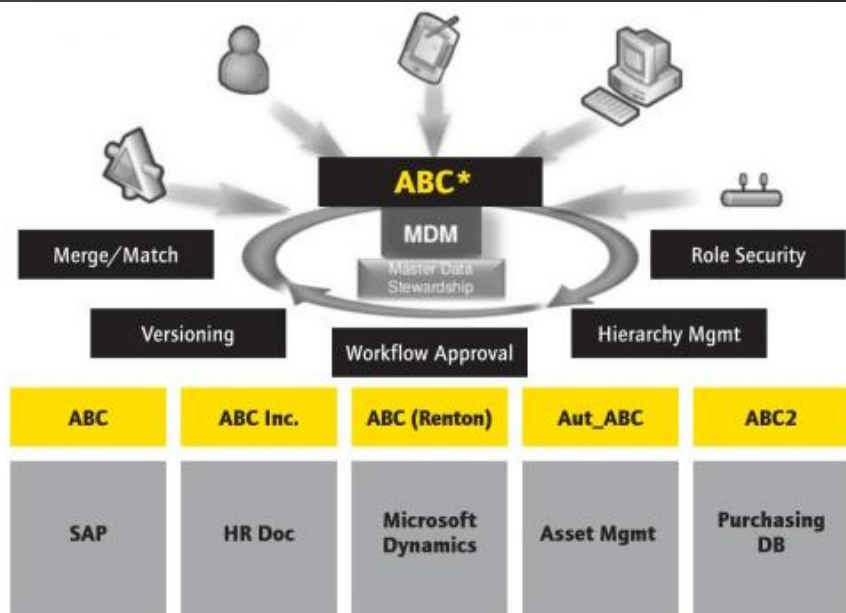

- Single view of anything that has attributes that can be matched
- Cleanup of source systems with business rules and golden records pushed back

**Before Master Data Management**

Golden Record  
Matching

**After Master Data Management**

# The main scenarios that a MDM solution must address involve Data Solutions, Data Warehouse Management, and Data Management

## Operational Data Management

*Central data records management and consumption sourced by other operational systems*

A company has adopted 6 new systems from a merger. The company needs the ability to propagate the correct customer information to each system in a consistent fashion. **MDS provides a platform for central schema, integration points and validation for Internal IT to develop a custom solution**

## Data Warehouse Management (Analytical)

*Enable business users to manage the dimensions and hierarchies of DW / Data Marts*

Example: Business users utilize a data warehouse for reporting, but complain about the accuracy of the dimensions and lack of agility for updates. **MDS empowers the business users to manage dimensions themselves while IT can govern the changes**

## Data Solutions

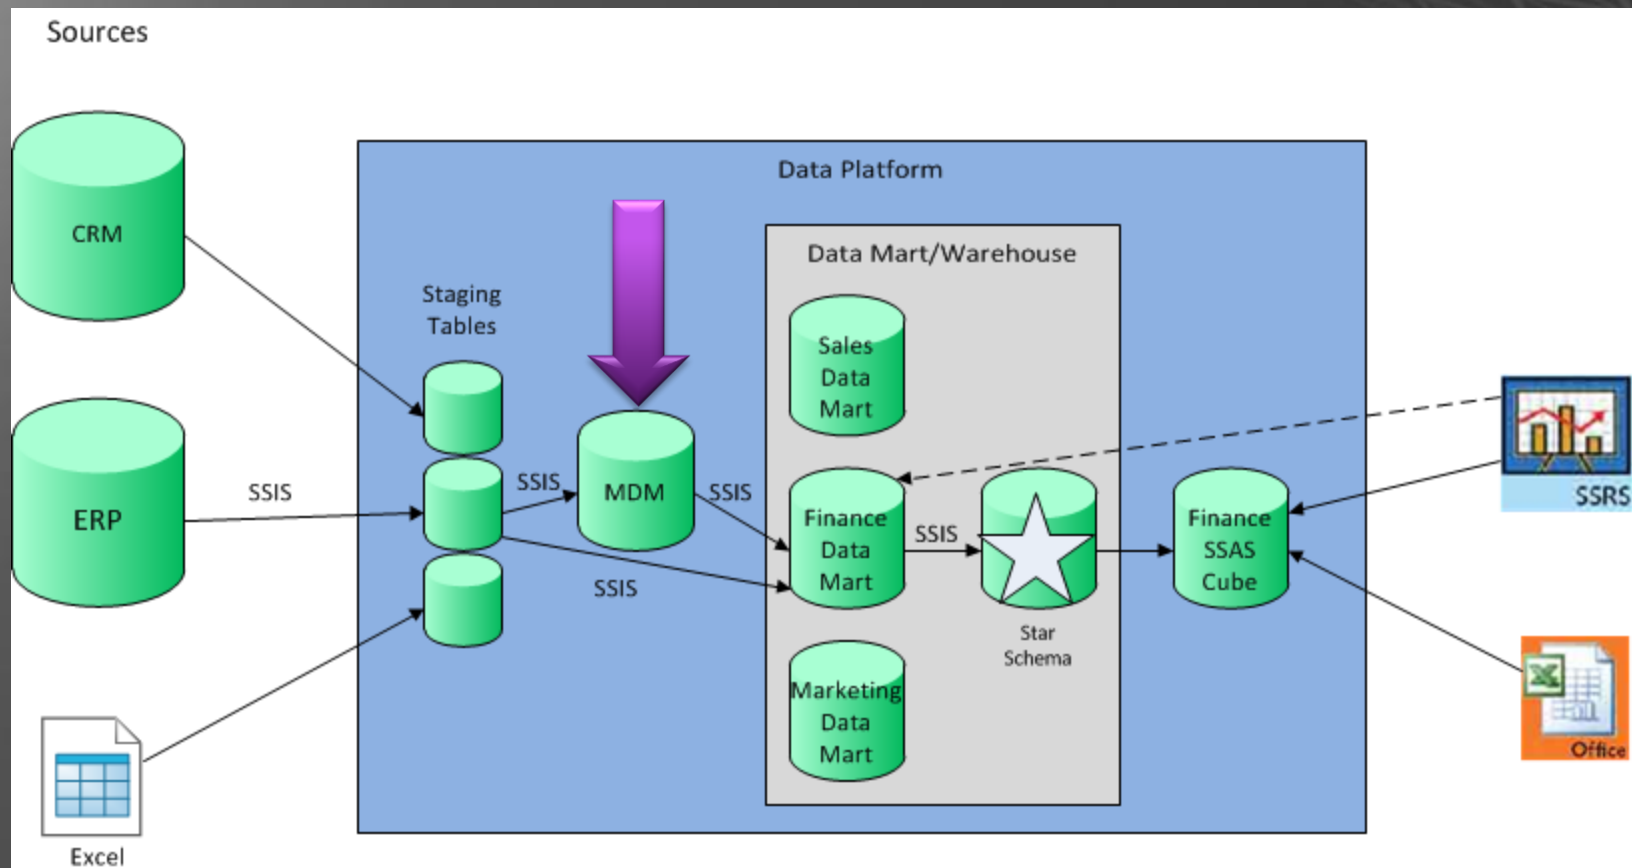

*Provides storage and management of the objects and metadata used as the application knowledge*

- **Object mappings**
- **Reference Data**
- **Metadata management**

Example: Table A houses mapping data between two systems, and is also utilized by ETL processes for data transformation decisions. **MDS enables business users to manage the object mapping**

# Where MDM fits in

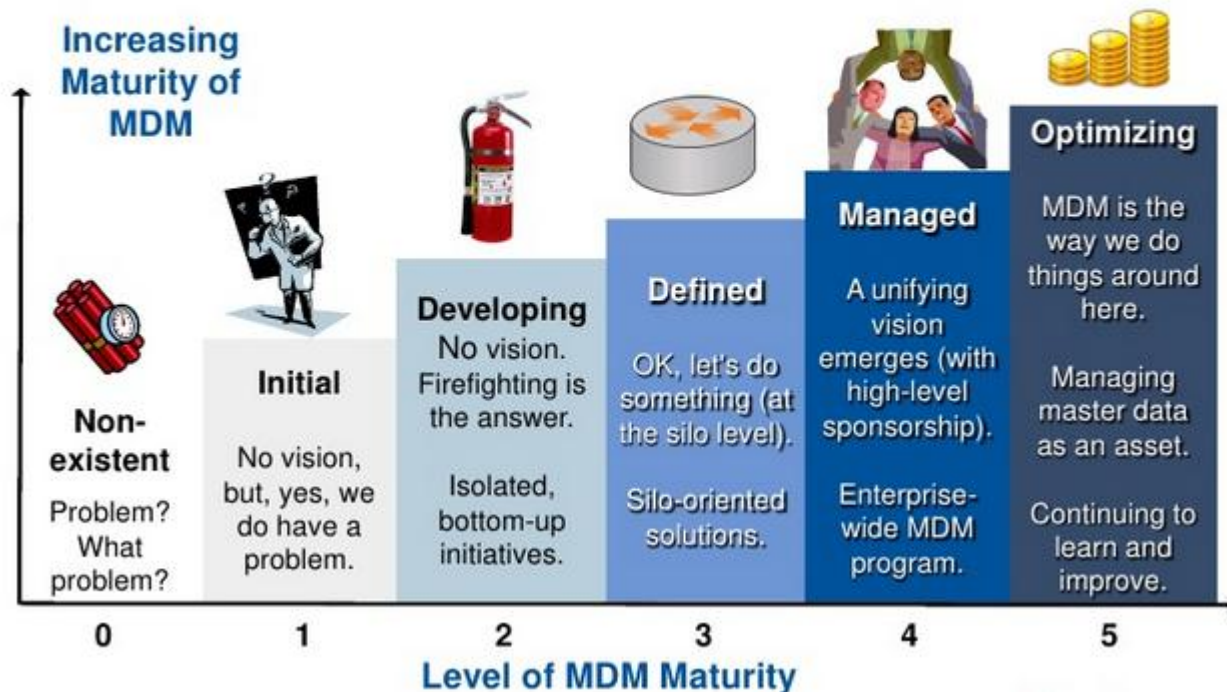

# MDM Hub Architecture Styles

- System of Entry (SOE) – Primary point of data entry. This may be direct entry or through services that update the data in virtual real time
- System of Record (SOR) – Most, if not all systems, receive their data from this source. When conflicts arise, this system is considered primary
- Repository – All master data is stored in the MDM hub, making it the SOR and SOE. Source systems are rewritten to get their master data from the MDM hub
- Registry – Data stays in each source system (SOE). All source system data records are mapped in the master data registry (SOR)
- Hybrid – Source systems are SOE, but most important attributes are replicated to hub

# MDM Maturity Model

## MDM Maturity Model: Helps You Determine Your Current and "To Be" States

# Why Master Data Services (MDS)?

- Do you want to manually create your own solution or use a product?
- Part of SQL Server 2008 R2 (Enterprise+) and SQL Server 2012 (BI+)
- Fraction of the cost of competing MDM products from Oracle, SAP, Informatica and other niche vendors
- Superior hierarchy management with full audit of changes
- Strong business rules managed by business people
- Single security model
- SOA and web services layer, work flow, and versioning
- Short implementation times with big business impact

# Master Data Services Benefits

- Align data across systems
  - Get a single version of the truth
  - Improve operational consistency
  - Improve reporting consistency
- Enable users to manage master data securely
  - Simplify the user experience with Web-based access
  - Reduce IT expense and process time by giving people direct and secure access to master data
  - Improve data quality across the enterprise
  - Flexibly add new data, systems and applications
- Ensure integrity of information
  - Manage critical hierarchies and master data attributes
  - Take advantage of comprehensive data cleansing
  - Be confident that data is accurate and up to date
  - Get more value from operational systems with authoritative data

# Master Data Services Key Features

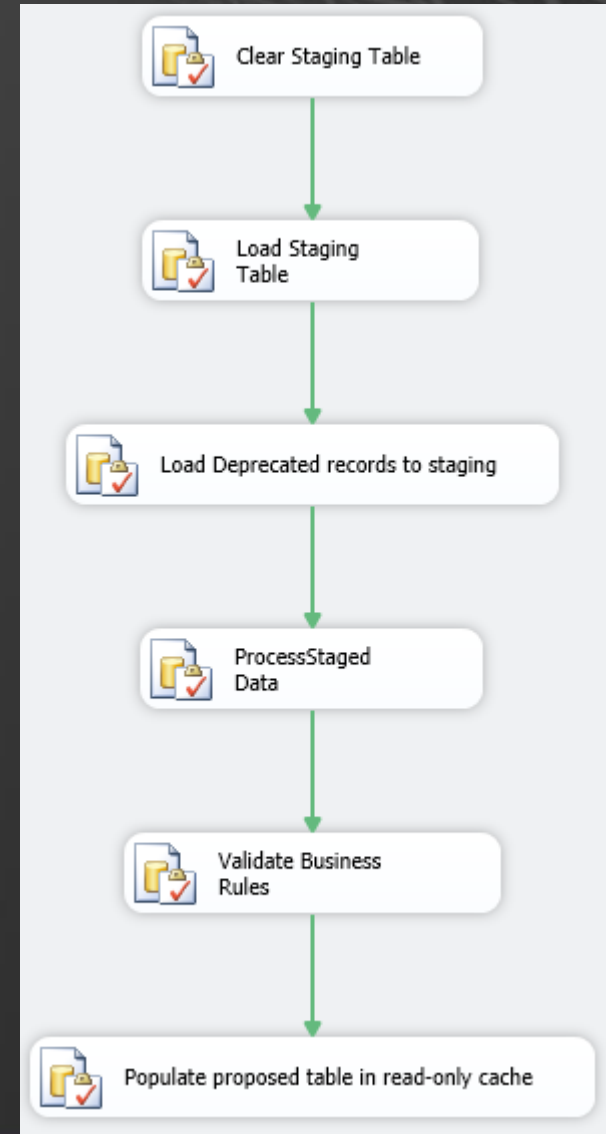

- Master data hub that provides central management of master data entities and hierarchies
- Thin-client stewardship portal that provides secure, role-based Web access to master data
- Versioning of all data entities and hierarchies
- Human workflow that notifies assigned owners by e-mail of business rule violations
- Flexible and extensible business rules that safeguard the quality of data entered in the master data hub
- Support for a broad range of hierarchy and attribute management strategies and requirements
- Comprehensive role-based security model that enables fine-grained, secure access to master data

# Interacting with Master Data Services

- Master Data Manager Web User Interface
- MDS Web Services API (WCF API)
- Stored procedures in the MDS database
- MDM tables via T-SQL
- MDS Add-in for Excel

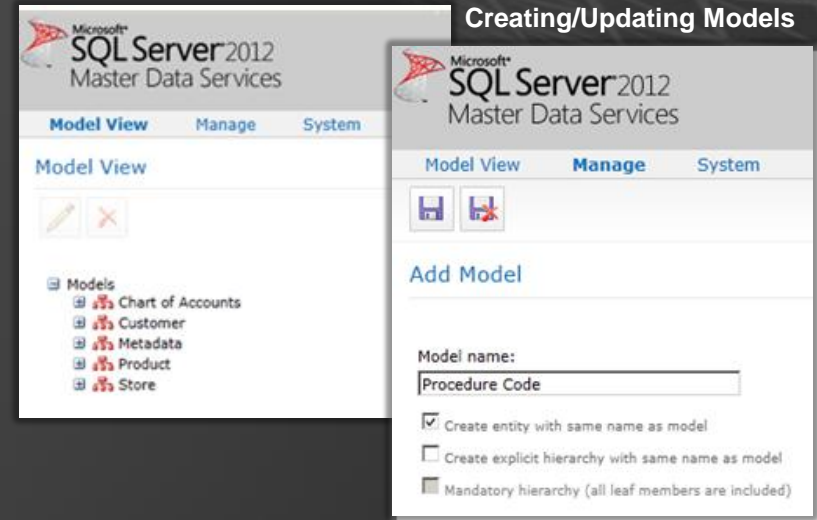

SSIS package that calls  
MDS stored procedures:

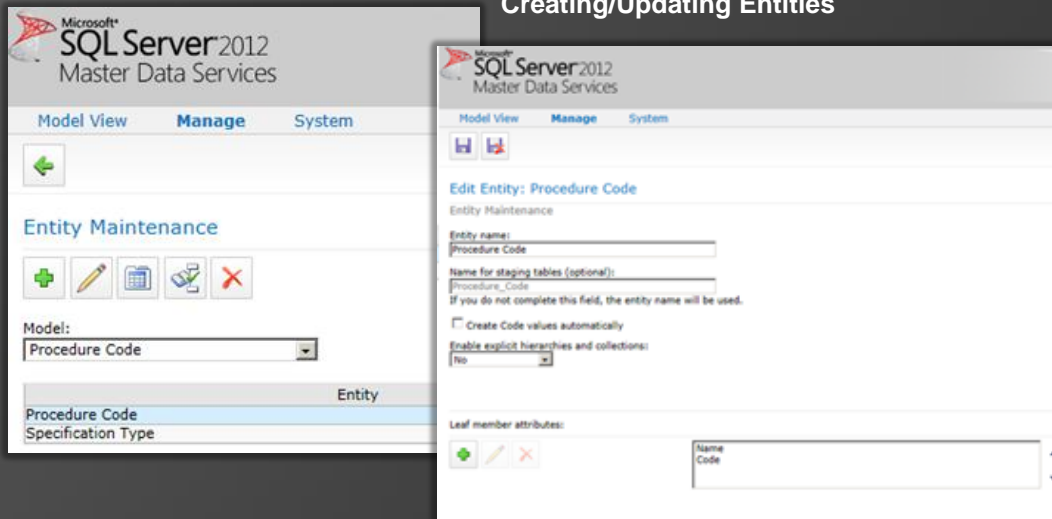

# The basis of an MDS solution involves Models, Entities, and Attributes

- ▶ The model is the most fundamental object in a MDS solution
- ▶ Models are the containers that encapsulate all other MDS objects (i.e. entities, hierarchies, collections, and business rules)

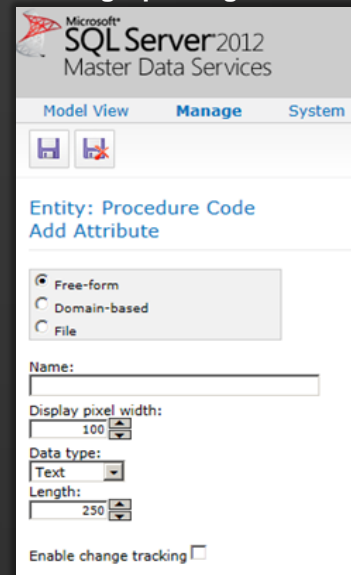

Database Analogy	
MDS Object	Database Object
Model	Schema
Entity	DB Table
Attribute	Column within DB Table
Member	Data Row

## Creating/Updating Entities

## Creating/Updating Attributes

# MDS Main Screen

## Information Worker Tasks

Model:  Version:   
Status: Open

**Business Users**

### Explorer

Work with master data and with hierarchy relationships.

### Install Master Data Services Add-in for Microsoft Excel

- Users can load and bulk edit data.
- Administrators can load data, create entities, and update attributes.

## Administrative Tasks

**Technical Users**

### System Administration

Build the model structure, create business rules, and deploy model packages.

### Integration Management

Import data into MDS and create SQL views for use by subscription systems.

### Version Management

Create versions of master data.

### User and Group Permissions

Assign permissions to master data.

# MDS Add-in for Excel

- Utilizing the Web or Excel Add-in with MDS allows business and technical users the ability to utilize whichever environment they feel most comfortable with
- The Excel Add-in for MDS allows users all the same abilities with MDS that the Web UI offers
- Users can update and view MDS data, as well as modify or create MDS objects such as Models or Entities
- A major benefit of the Excel Add-in is the ability to quickly bulk load data into MDS
- The Excel Add-in provides users the ability to use Data Quality Services to clean data before it moves into MDS

# MDS Capabilities

## Modeling

Entities, Attributes, Hierarchies

## Validation

Authoring business rules to ensure data correctness

Role-based Security and Transaction Annotation

Excel Add-In

MDS

Master Data Stewardship

Web UI

Data Matching (DQS Integrated)

Versioning

## Enabling Integration & Sharing

Loading batched data through Staging Tables

Registering to changes through APIs

Consuming data through Subscription Views

Workflow / Notifications

Excel

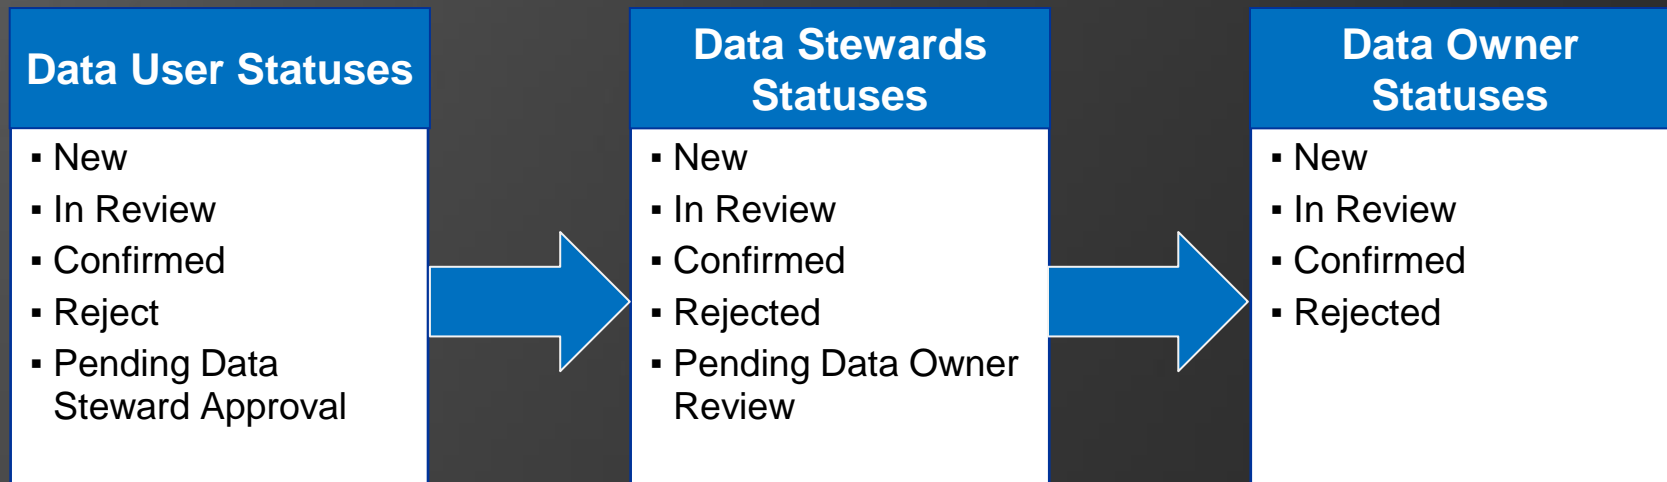

DWH

External (CRM, ..)

# Data Governance

- Process by which you manage the quality, consistency, usability, security, and availability of the organization's data
- If bad data in source:
  - Clean data in MDS, tell source system to fix it
  - Interface back to source to automatically fix it
  - MDS is system of record – not using source data

Status of data review:

# Why Profisee Master Data Maestro?

- Original developers of MDS as Stratature
- Platform built on top of MDS - uses MDS API
- Easier, faster, and customizable UI
- Adaptive modeling
- Integrated data quality validation and review
- Matching and master record creation (golden record)
- Interface to review, approve, or reject matching results
- Address verification & standardization with Bing/Melissa
- SDK and workflow integration components
- Bi-directional cut, copy, and paste to/from Microsoft Excel
- Metadata caching and deferred publishing

# Demo

- SSIS package to stage data into MDS
- MDS Web UI
- MDS Add-in for Excel
- Master Data Maestro
